The compounds of formula (I) of the present invention thus obtained can be separated by employing a conventional separation and purification procedure such as extraction, concentration, neutralization, filtration, recrystallization, column chromatography or thin layer chromatography from the reaction mixture.

The compounds of formula (I) having an asymmetric carbon is usually formed as racemates. Thus obtained racemates can be led to individual optical isomers by forming salts with an optically active acid (e.g. mandelic acid, tartaric acid, dibenzoyltartaric acid or 10-camphorsulfonic acid) or an optically active base (e.g. cinchonine, cinchonidine, quinine, quinidine, α -methylbenzylamine or dehydroabiethylamine), or by separating with chromatography or fractional recrystallization. The optically active isomers can also be prepared by using optically active starting compounds.

The starting compounds of formula (II) can, for example, be prepared by reacting a compound of the formula:

wherein X^3 is halogen and other symbols are as defined above, with 2,6-di-tertiary butyl phenol under the condition of Friedel-Crafts reaction, i.e., in the presence of a catalyst (e.g. aluminum chloride, ferric chloride, stannic chloride or zinc chloride) in an inert solvent (e.g. dichloroethane, tetrachloroethane, carbon disulfide or nitrobenzene).

Since the compounds of formula (II) are novel compounds, the present invention also provides the compounds of formula (II) which are industrially useful as intermediates to the novel and pharmaceutically valuable compounds of formula (I).

The pyrazolopyridine compounds of formula (I) and salts thereof of the present invention not only inhibit both cyclooxygenase and 5-lipoxygenase but also exhibit potent antiinflammatory activity, analgesic activity, antipyretic activity, antiallergic activity, antiarthritic activity, antirheumatic activity or inhibitory activity on platelet aggregation, and are useful as drugs such as antiinflammatory agents, analgesics, antipyretic agents, antiallergic agents, antiarthritic agents, antirheumatic agents or platelet aggregation inhibitors.

When the compounds of the present invention and the pharmaceutically acceptable salts thereof are used as drugs, they can be orally or parenterally administered alone or in the form of powder, granules, tablets inclusive of filmcoated tablets and sugar coated tablets, capsules, injections, drip infusions, suppositories, ointments, cataplasms or eye drops prepared by admixing with pharmaceutically acceptable carriers, vehicles or diluents to patients in need of therapy. The dose may vary depending upon the diseases to be treated, the conditions of patient, the age of patient or way of administration, and in case of oral administration, the daily dose for human adults ranges from 1 to 1,000 mg, preferably from 50 to 500 mg in one to several times divided doses.

The following are the results of pharmacological experiments exhibiting the effectiveness of the pyrazolopyridine compounds (I) or their salts of the present invention.

Pharmacological experiment 1. Analgesic Activity

The experiment was performed according to the method of Hendershot et al described in J. Pharmacol. Exp. Ther., vol. 125, P. 237 (1959). Male ddY mice weighing 18-25 g were used in groups of 6-18. One hour
15 after the oral administration of test compound solution (10 ml/kg), 10 ml/kg of 0.02% aqueous phenyl-quinone solution was intraperitoneally administered to the animal. The frequency of stretch symptom thus induced measured for 20 minutes. The inhibitory rate was determined in comparison with the control group and the 50% effective dose (ED₅₀, mg/kg) was calculated according to the linear regression method.

20

Pharmacological experiment 2. Effect on Acute Inflammation

The experiment was performed according to the method of Winter et al described in Proc. Soc. Exp. Biol. Med., vol. 111, p. 544 (1962). Male Donryu rats weighing about 140 g which was fastened for 18 hours
25 were used in groups of five animals. Test compound solution was orally administered and one hour later, 0.05 ml of saline solution containing 1% carrageenin was injected into the right hind paw. Three hours later, the foot volume was measured by the water displacement method. The rate of increase against the foot volume before the injection of carrageenin was calculated, and the inhibitory rate was determined as compared with the control group. The 50% effective dose (ED₅₀, mg/kg) was determined by the linear
30 regression method.

Pharmacological experiment 3. Effect on Chronic Inflammation

The experiment was performed by employing 10-week old male Lewis rats according to the method of Newbould described in Brit. J. Pharmacol., vol. 21, p. 127 (1963). Dead tubercle bacilli (R₆H₅ type) suspended in liquid paraffin (0.5 mg/0.1 ml) was inoculated as adjuvant into the skin at the base of tail. Animals with arthritis were chosen on the 15th day and divided into groups of seven. Test compound
35 solution (5 ml/kg) was orally administered once a day from 15th day of 24th day consecutively. The rate of change of the foot volume on the 24th day against the foot volume on the 15th day was calculated, and the inhibitory rate was determined as compared with the control group. The minimum effective dose (MED, mg/kg) was obtained based on the dose indicating the decrease of foot volume than the foot volume on the 15th day.

45

Pharmacological experiment 3. Effect on the Platelet Aggregation induced by Arachidonic Acid

Male Hartley guinea pigs weighing 400-500 g were subjected to the abdominal operation under etherization. The citrated blood (9 volumes of blood and one volume of 3.8% sodium citrate solution) was
50 collected from the abdominal aorta. Immediately, the blood was centrifuged at 150 × g for 3 minutes to obtain platelet-rich plasma (PRP) as a supernatant. The remaining blood was centrifuged at 1400 × g for 10 minutes to obtain platelet-poor plasma (PPP) as a supernatant. The number of platelet in PRP was adjusted to 4-6 × 10⁵ platelets/mm³ by adding PPP thereto. The platelet aggregation was measured by using a platelet aggregometer according to the method of Born et al described in J. Physiol., vol. 168, p.
55 178 (1963). Test compound solution was added to PRP under stirring at 1500 rpm at 37°C, and two minutes later arachidonic acid (final concentration: 5 × 10⁻⁴ M) is added thereto. The change of

transmittance was recorded consecutively. The transmittance was adjusted to 0 and 100% with PRP and PPP, respectively. The inhibitory rate was calculated against the control group by using the maximum aggregation value as an index, and 50% inhibitory concentration (IC₅₀, µg/ml) was determined by the linear regression method.
